Fall, 2025 Lecture 18

The random variable X denotes certain metric (e.g. height, weight) we are interested in from a population, and  $X \sim \mathcal{N}(\mu, \sigma^2)$ . We draw a random sample of size n from the population. Like we discussed during the lecture, a random sample of size n can be thought as n i.i.d. random variables. That is:

$$\boldsymbol{X}_1, \boldsymbol{X}_2, \boldsymbol{X}_3, \cdots, \boldsymbol{X}_n \sim \mathcal{N}(\mu, \sigma^2)$$

We have seen that the maximum likelihood estimator for  $\sigma^2$  is:

$$\hat{\boldsymbol{\sigma^2}} = \frac{1}{n} \sum_{i=1}^{n} (\boldsymbol{X}_i - \bar{\boldsymbol{X}})^2$$

Then, what is  $\mathbb{E}\left[\hat{\sigma^2}\right]$ ? If  $\mathbb{E}\left[\hat{\sigma^2}\right] = \sigma^2$ , it is an unbiased estimator. Otherwise, it is a biased one.

Now let's have a look.

$$\mathbb{E}\left[\hat{\boldsymbol{\sigma}^2}\right] = \mathbb{E}\left[\frac{1}{n}\sum_{i=1}^n (\boldsymbol{X}_i - \bar{\boldsymbol{X}})^2\right] = \frac{1}{n}\mathbb{E}\left[\sum_{i=1}^n (\boldsymbol{X}_i^2 - 2\bar{\boldsymbol{X}}\boldsymbol{X}_i + \bar{\boldsymbol{X}}^2)\right]$$
$$= \frac{1}{n}\mathbb{E}\left[\sum_{i=1}^n \boldsymbol{X}_i^2 - 2\bar{\boldsymbol{X}}\sum_{i=1}^n \boldsymbol{X}_i + \sum_{i=1}^n \bar{\boldsymbol{X}}^2\right]$$

Note that:  $\sum_{i=1}^{n} \boldsymbol{X}_{i} = n\bar{\boldsymbol{X}}$ . Since  $\bar{\boldsymbol{X}}$  remains the same for each i, we have  $\sum_{i=1}^{n} \bar{\boldsymbol{X}}^{2} = n\bar{\boldsymbol{X}}^{2}$ . Replacing the blue terms above, we have:

$$\mathbb{E}\left[\hat{\boldsymbol{\sigma}^2}\right] = \frac{1}{n} \mathbb{E}\left[\sum_{i=1}^n \boldsymbol{X}_i^2 - 2\bar{\boldsymbol{X}} \cdot n\bar{\boldsymbol{X}} + n\bar{\boldsymbol{X}}^2\right] = \frac{1}{n} \mathbb{E}\left[\sum_{i=1}^n \boldsymbol{X}_i^2 - n\bar{\boldsymbol{X}}^2\right] \\
= \frac{1}{n} \left(\mathbb{E}\left[\sum_{i=1}^n \boldsymbol{X}_i^2\right] - \mathbb{E}\left[n\bar{\boldsymbol{X}}^2\right]\right) \tag{1}$$

Since  $\mathbb{V}ar(\boldsymbol{X}) = \mathbb{E}\left[\boldsymbol{X}^2\right] - (\mathbb{E}\left[\boldsymbol{X}\right])^2$ , so we have  $\mathbb{E}\left[\boldsymbol{X}^2\right] = \mathbb{V}ar(\boldsymbol{X}) + (\mathbb{E}\left[\boldsymbol{X}\right])^2$ ,

Fall, 2025 Lecture 18

then,

$$\mathbb{E}\left[\sum_{i=1}^{n} \boldsymbol{X}_{i}^{2}\right] = \mathbb{E}\left[\boldsymbol{X}_{1}^{2}\right] + \mathbb{E}\left[\boldsymbol{X}_{2}^{2}\right] + \mathbb{E}\left[\boldsymbol{X}_{3}^{2}\right] + \dots + \mathbb{E}\left[\boldsymbol{X}_{n}^{2}\right]$$

$$= \mathbb{V}\operatorname{ar}\left(\boldsymbol{X}_{1}\right) + (\mathbb{E}\left[\boldsymbol{X}_{1}\right])^{2} + \mathbb{V}\operatorname{ar}\left(\boldsymbol{X}_{2}\right) + (\mathbb{E}\left[\boldsymbol{X}_{2}\right])^{2} + \dots$$

$$+ \mathbb{V}\operatorname{ar}\left(\boldsymbol{X}_{n}\right) + (\mathbb{E}\left[\boldsymbol{X}_{n}\right])^{2}$$

$$= \sigma^{2} + \mu^{2} + \sigma^{2} + \mu^{2} + \dots + \sigma^{2} + \mu^{2}$$

$$= n\sigma^{2} + n\mu^{2}$$

$$(2)$$

Putting equation (2) into equation (1), we have:

$$\mathbb{E}\left[\hat{\boldsymbol{\sigma}^2}\right] = \sigma^2 + \mu^2 - \frac{1}{n} \cdot \mathbb{E}\left[n\bar{\boldsymbol{X}}^2\right] = \sigma^2 + \mu^2 - \mathbb{E}\left[\bar{\boldsymbol{X}}^2\right]$$
$$= \sigma^2 + \mu^2 - (\sigma_{\bar{X}}^2 + \mu_{\bar{X}}^2) \tag{3}$$

According to the central limit theorem, we have  $\mu_{\bar{X}} = \mu$  and  $\sigma_{\bar{X}}^2 = \frac{\sigma^2}{n}$ . Therefore, equation (3) becomes:

$$\mathbb{E}\left[\hat{\boldsymbol{\sigma}^2}\right] = \sigma^2 + \mu^2 - \frac{\sigma^2}{n} - \mu^2 = \frac{n-1}{n}\sigma^2 \neq \sigma^2$$

Hence, it is not an unbiased estimator.
